The sequence encoding the P195 protein of Plasmodium falciparum (N50530) and a peptide comprising at least one of its epitopes (see P50777) are claimed. Also claimed is a vaccine for inducing immunity to malaria comprising the novel peptide or P195 or a peptide comprising at least one epitope when derived from the new DNA sequence, together with a carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             be produced outside the parasite and has, at least over extended regions, the native pattern of folding. Larger amounts of the protein can be produced recombinantly than would be possible using the parasites as

In particular the gene sequences comprising the following parts of the full gene:

(1) bases 8081-9441, 12314-13084 and 1389-32520;
(2) bases 8081-9441, 12314-13084, 1389-32520;
(3) bases 8081-9441, 9681-13084 and 13889-32520;
(4) bases 8081-9441, 9681-13084 and 13889-32520 and 34627-35564; and (5) bases 8081-9441, 9681-13084 and 13889-35504, are claimed.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                praft entry and computer-readable copy for [1] kindly provided be C.Nicolet, 09-DEC-1985. Draft entry and sequence in computer readable form for [2] kindly provided by C.Nicolet, 08-OCT-1986. The unidentified reading frame (positions 534-647) overlaps the start of the RAD2 coding region. The translation of the RAD2 protein might reinitiate from the 'atg' codon at position 652, encoding a RAD2 protein missing the 26-amino terminal residues. polyadenylation signal is present at positions 3532-3537.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Madura, K. and Prakash, S.

Scoring table: TABLE default Gap 10

Nmatch STD: Dbase 0; Query 0

1052 seqs, 1486975 bases x 2

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

HIV-NA8 1:H\_PRI 2:H\_UNA 3:H\_VIR

Statistics: Mean 6.893; Variance 1.353; scale 5.094

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                   This sequence was obtained as part of a study designed to determine the in vivo extent of HIV-2 genetic and biological variation. Up to now, HIV-2 sequences have been derived almost solely from cultured isolates. Since cultivation may select against viruses which can not grow in a particular cell type, Gao et al. argue that a greater variation may be elucidated by sequencing virus obtained from uncultured PBMCs. With this aim in mind, peripheral blood samples were collected from 12 HIV-2 seropositive patients (2238, 60415K, 60667K, 7312A, 7810A, 7924A, FA, FO784, FT, JA, ON, and PA) from six different west African countries, living in both urban and rural areas. Uncultured PBMC DNA was PCR amplified, and the recombinant clones were manually sequenced. Another portion of the cells was used for virus isolation.

Patient 7924 was a heterosexual 48-year old teacher from Guinea Bissau, who was living in the Washington, D.C. area. Originally he lived in an urban area in West Africa before traveling extensively and coming to the United States. After seeking medical care for a STD, patient 7924 was identified as HIV-2 positive. Subsequent Western blot analysis of peripheral blood cells showed HIV dual reactivity. Virus isolation was successfully performed at the University of Alabama at Birmingham. [1] suggests that this may account for SIVAGMTYO's lack of pathogenicity. The env to the in-frame stop codon at positions 8077-8079, similar to the in-frame stop codons found in the SIV macaque and HIV-2 ROD35 envelope coding regions, except that SIVAGMTYO's stop codon is found 96bp downstream from the 3' splice junction of tat and rev, which is the location of the stop codon in the other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   [1] finds that SIVAGMTYO is approximately equally distantly related to the HIV-1's and the HIV-2/SIV (macaque) group; over a "conserved" stretch of the pol protein, TYO is only 87% similar to AGM385 and 82% similar to AGM266, the latter two differing by 20%.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequences.

The typical stop codon "tag" in rev (position 8574) is "cag" making rev in SIVgri-1 (lambdaII) longer than rev in most other sequences. The gri-1 sequence is the most divergent primate lentivirus reported to date.

```

27 late-time-point clones obtained from 2 rhesus monkeys infected with SIVMM239 were used to quantify variation in the gpl20 region [3] describes the pathogenic potential of SIVMM239

COMMENT

TITLE

TITLE

Macaque lymphocytes supported the replication of SIVMM239 and SIVMM251 but not SIVMM142 or HIV2ROD [5].

See also <SIVMM1A11> (accession number M76764); SIVMM239 and SIVMM1A11 show greater than 98% homology at the nucleotide level Analysis in [6] largely focuses on sequence differences in SIVMM and SIVMM1A11 which may account for differences in biologic properties [6]. in SIVMM239

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Two wild yellow baboons from Tanzania were identified in a previous study with strong SIV(agm) seroreactivity. They lived in a national park where yellow baboons and African green monkeys share the same habitat. In this study, molecular characterization was performed for virus derived from one of the SIVagm seroreactive yellow baboons (animal 2010) and from two vervet African green monkeys (animals ver266 and ver385). With this aim in mind, uncultured leukocyte DNA was PCR-amplified, cloned and sequenced over a 672 bp region of gag and a 906 bp region of env for animal 2010 (only the env region was analyzed for isolates ver266 and ver385). Jin et al. note that the viral strain derived from the yellow baboon (animal 2010) clusters with SIV strains of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SIV2010G
